

Copernicus FICE 2025

Training on
In situ Ocean Colour Above-Water Radiometry towards Satellite Validation

EUMETSAT welcomes you to Copernicus FICE 2025

Juan Gossn, Ewa Kwiatkowska and Hayley Evers-King
EUMETSAT

6-20 July 2025
Venice, Italy

Why are we here today?

copernicus.eumetsat.int

A chain of reasons:

1. We are here to improve the quality of **Ocean Colour observations** from space
 2. To improve **Ocean Colour observations** we must validate them with **field measurements**
 3. Our **field measurements** must be acquired with **trustworthy instruments, protocols, procedures, QA/QC, etc...**
 4. To **trust** our measurements and use them for **validation of OC satellite products**, we must **understand them (our geophysical measurand, our instrument, our practices before, during and after the field)** and make field measurements follow **internationally agreed practices**
- This event is part of a project (**FRM4SOC - 2, Fiducial Reference Measurements for Satellite Ocean Colour – Phase 2**) that is **advancing our knowledge on OC field radiometry** but also helping the **community** to arrive to these agreed practices.

This **training** is a key element to fulfil FRM4SOC's major goal:
Promote FRM principles across the Ocean Colour community

Why are we here today?

copernicus.eumetsat.int

What are **Fiducial Reference Measurements (FRMs)**?

A suite of **independent, fully characterised, and traceable** (to a **community agreed reference, ideally SI**) measurements of a **satellite relevant measurand**, tailored specifically to address the **calibration/validation needs** of a **class of satellite borne sensors**, and following the guidelines outlined by the GEO/CEOS Quality Assurance framework for Earth Observation (QA4EO)

[Goryl et al. 2023]

$$u_c^2(y) = \sum_{i=1}^N \left(\frac{\partial f}{\partial x_i} \right)^2 u^2(x_i) + 2 \sum_{i=1}^{N-1} \sum_{j=i+1}^N \frac{\partial f}{\partial x_i} \frac{\partial f}{\partial x_j} u(x_i, x_j) .$$

This **training** is a key element to fulfil FRM4SOC's major goal:
Promote FRM principles across the Ocean Colour community

9. **Review, test and promote:** field comparisons, training, international workshops, feedback from experts

1. **Field radiometer classes** to conform to the FRMOCnet standards

+ ...

2. **Full characterisation** of batches of field radiometers and a service of free calibrations and rentals of fully calibrated/characterised instruments

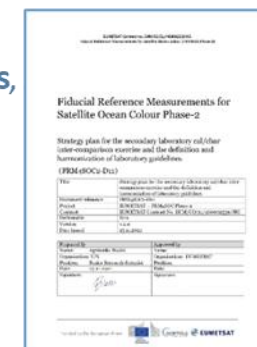

Parameter	Scope
1. Absolute calibration for radiometric responsivity	individual
2. Long term stability	individual
3. Stray light and out of band response	individual
4. Immersion factor (irradiance)	individual
5. Immersion factor (radiance)	individual
6. Angular response of irradiance sensors in air	class specific
7. Response angle (FOV) of radiance sensors in air	individual
8. Non-linearity	individual
9. Accuracy of integration times	individual
10. Dark signal	individual
11. Thermal responsivity	individual
12. Polarisation sensitivity	individual
13. Temporal response	class specific
14. Wavelength scale	TBD
15. Signal-to-noise ratio	class specific
16. Pressure effects	individual

3. **Community guidelines** on radiometer cal/char standards and FRM certification

fiducial reference measurements for satellite ocean colour
<https://frm4soc2.eumetsat.int>

Promoting the adoption of FRM principles across the community

4. Radiometer cal/char **guidelines for laboratories**, international lab exercises and continuous communication with manufacturers and users

5. In situ **measurement procedures**, specific to the radiometer classes, and recommendations that complement those in the IOCCG protocols

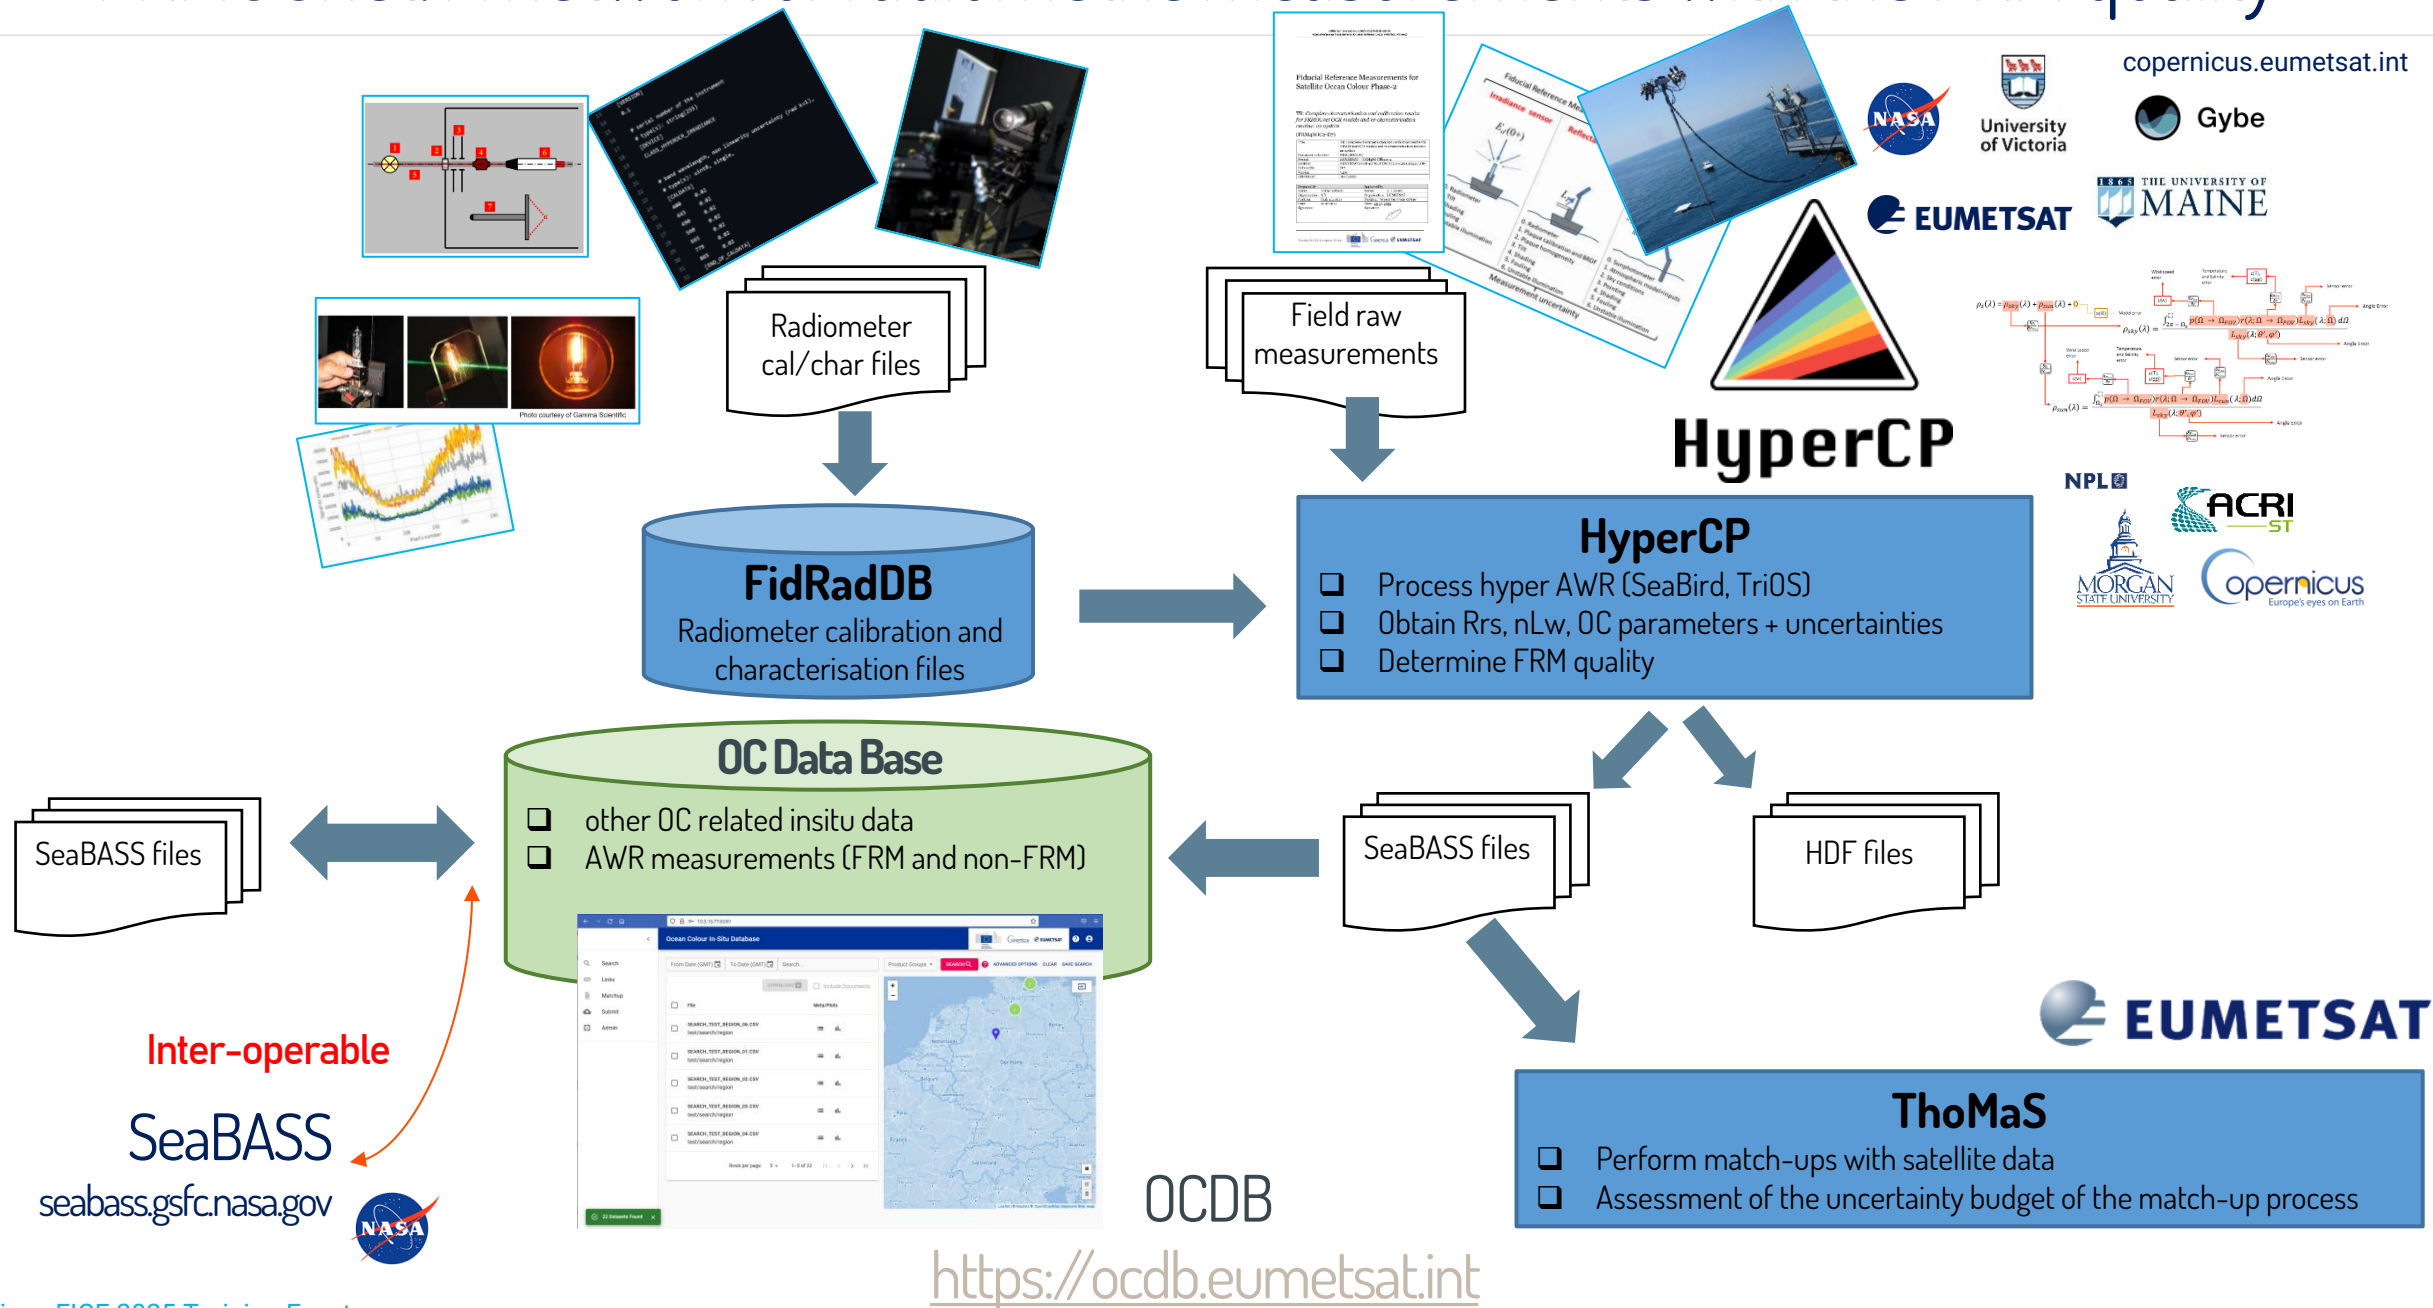

8. Maintenance of Ocean Colour **In-Situ Database** OCDB, Fiducial Radiometer Data Base FidRadDB and promotion of their use
<https://ocdb.eumetsat.int/>

7. Complete **end-to-end uncertainty budget** included in HyperCP, thoroughly documented and clear to users

6. **HyperCP community processor** for hyperspectral above-water radiometric measurements, extension of use cases
<https://github.com/nasa/HyperCP/tree/master>

FRMOCnet: A network of radiometric measurements with the FRM quality

The development and implementation of the FRM principles is an incremental process.
FRM4SOC phase 2 is built on the decades of work done previously by several teams worldwide.

Copernicus FRM4SOC-2025 Training In Above- Water Radiometry – APPLY NOW!

19.12.2024

The Second Edition of the EU Copernicus
Programme FRM4SOC Training for in situ Ocean
Colour Above-Water Radiometry towards
Satellite Validation will be held in July 2025 in
Venice and nearby Acqua Alta Oceanographic
Tower (AAOT) in the Adriatic Sea.

Being in FICE 2025: A unique opportunity!

copernicus.eumetsat.int

- Unique chance to learn from top experts in **Ocean Colour (OC) radiometry** about the complexity of the **physical processes during field measurements**, evaluate the impact of several **uncertainty sources**, and experience a **live demonstration** on how to apply measurement protocols and procedures correctly in the field.

Dealing with radiometers in the field is not an easy task.

- We will discuss the **challenges in collecting high-quality measurements** and understand their **uncertainties**.
- We will provide **community tools** developed partly within our project to process raw outputs from radiometers to measurement results with metrologically sound uncertainty estimates for performing satellite matchups.

Welcome to the International

Promoting development and applications of science and technology that underpin remote sensing of ocean colour across all aquatic environments (in-land, coastal, open-ocean) through coordination, training, and provision of expert advice.

The International Ocean Colour Coordinating Group (IOCCG) is an international group of experts comprised of representatives from national space agencies and remote sensing experts in the aquatic radiometry user community. It was established in 1996 under the auspices of the Intergovernmental Oceanographic Commission of UNESCO, following a request from the Committee on Earth Observation Satellites (CEOS). IOCCG promotes the development and applications of science and technology that underpin remote sensing of ocean colour across all aquatic environments (in-land, coastal, open-ocean) through coordination, training, and provision of expert advice. Objectives include developing consensus and synthesis at the world scale in the subject area of satellite ocean colour radiometry (OCR), establishing specialised scientific working groups to investigate various aspects of ocean colour technology and its applications, and addressing continuity and consistency of ocean colour radiance datasets through the CEOS OCR-Virtual Constellation. The IOCCG also has a strong interest in capacity building, and conducts and sponsors advanced ocean colour training courses in various countries around the world.

The IOCCG is an affiliated project of the Scientific Committee on Oceanic Research (SCOR) and an associate member of CEOS. The activities of the IOCCG are supported by national space agencies and other organisations, and by infrastructure support from SCOR and the Bedford Institute of Oceanography (Department of Fisheries and Oceans, Canada) where the IOCCG Project Office is hosted.

Who are EUMETSAT?

copernicus.eumetsat.int

The European Organisation for the Exploitation of Meteorological Satellites

- Located in Darmstadt, Germany
- Founded in 1986, consists of 30 member states
- Two mandates:
 - Weather and Climate data for member states
 - Additional capabilities with EU and beyond:
 - Copernicus programme

EUMETSAT missions for marine – current and future

Mandatory Programmes

Optional Programmes

Copernicus Programme

Marine missions: Sentinel-3 mission and configuration

- The “blue” sentinel; suite of ocean observing instruments.
- Main objectives: acquire sea-surface topography, sea surface temperature and ocean colour data.
- Constellation of two platforms:
 - Sentinel-3A launched February 2016
 - Sentinel-3B launched April 2018
 - Sentinel-3C planned mid-2026
- Sun-synchronous 98.65° polar orbit, 27 day cycle.
- Near global coverage; <2 day revisit (optical) & <1 day (thermal)

PROGRAMME OF
THE EUROPEAN UNION

IMPLEMENTED BY

Marine missions: Sentinel-3 operations and data distribution

- EUMETSAT operates the satellite & provides the marine data stream at **level-1** and **level-2**
- Supports the generation of **level-3** and **level-4** products by the **Copernicus Marine Service** (primary user)
- Operational and reprocessed data made directly available to users via the **EUMETSAT Data Store**
- Redistributed (and used) by NOAA
- Atmospheric products also available through EUMETSAT
- Land products available through ESA

PROGRAMME OF
THE EUROPEAN UNION

IMPLEMENTED BY

Dr Hayley Evers-King (EUMETSAT): Lead Marine Applications Expert, User Support and Climate Division

Hayley provides user support and training on ocean applications of satellite data, and manages feedback between user(s) and operational satellite agencies. She has worked throughout the satellite data value chain; from the validation of satellite sensor measurements, to algorithm and application development. She is a keen programmer and a passionate science communicator. Prior to her current role, Hayley worked for 5 years as a Marine Earth Observation Scientist at Plymouth Marine Laboratory. She obtained a PhD in ocean colour remote sensing from the University of Cape Town, South Africa in 2014.

Dr Juan Ignacio Gossn (EUMETSAT): Remote Sensing Scientist; Ocean Colour

Juan Gossn was born in 1990 in San Isidro, Argentina. He is a remote sensing scientist specializing in Ocean Colour remote sensing. With a background in Physics from the University of Buenos Aires, he obtained his Ph.D. from the Argentinean Institute of Astronomy and Space Physics (IAFE – CONICET/UBA), focusing on the extremely turbid waters of Río de la Plata. In 2021, he joined EUMETSAT's Ocean Colour Services team, where he contributes to the improvement of operational ocean colour products through the analysis of in situ data and managing scientific studies.
